PHASE 1

MALESELA LAZARUS SEHLAPELO

1.Idea / Scenario Choice

This project I chose Chef Christoffel Restaurant. My idea is to make a website for customers and a mobile app for the chef. The app will help the chef manage the menu on his phone instead of writing on paper. The website will show the menu to customers so they can see food and prices before coming to the restaurant.The app will have Add dish, View all dishes, Edit dish, and Delete dish. The website will have Home, About Us, Menu, and Contact pages.

2. Why I chose this scenario

I chose this scenario because it is a real problem that I understand. Many small restaurants still use paper and it gets lost or messy. I also chose it because I already used this idea in my MAST module so I know what the chef needs. It is also not too difficult to build and it is useful for a small business. It can also grow later if the client wants online ordering.

3. Who is the client and what does the client want

The client is Chef Christoffel. He owns a small restaurant called Christoffel's Kitchen. He is the head chef and he also manages the menu.What he wants is a simple system. He told me he wants to:Add new dishes fast when he makes something new.Change the price easily when ingredients become expensive.Delete food that is finished or not available.Let customers see the menu online.

He wants the app to be simple with big buttons because he is always busy cooking and his hands are sometimes wet.

4. What is User-Centred Design

User-centred design means designing for the user and not for yourself. It means you must think about what the user needs and make the app easy for them. You must involve the user in the design and test with them. For my project it means I made the app easy for the chef - I used Picker for course so he does not type wrong, I used numeric keyboard for price, and I used only two screens so he does not get confused.

5. Colour Palette

My colour palette has 3 colours.First colour is Red . I chose red because it is common for restaurants and it makes people hungry. I will use it for buttons and title.Second colour is White for background. White is clean and makes text easy to read.Third colour is Black for text. Black on white has good contrast.I also added Gold for logo. Gold makes it look a bit fancy but still simple. The colours are not too many and they match the restaurant.

6. Logo Design

I designed a logo with a chef hat and a fork inside. Under it I wrote Christoffel's Kitchen.I chose chef hat because it shows it is about cooking. The fork shows food. The font is bold and simple so it is easy to read on phone. The hat is white with red border and fork is gold.The logo is simple and not complicated, so even on a small app icon you can still see what it is. It shows the purpose of the business which is food and restaurant. It will look good on both app and website.
